                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                    The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins should be effective as chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helixo-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis {\sf C}

                                                                                                                                                              The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                       ö
                                                                                                                       The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                 The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the Polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1 MKKKGSVVIVGRINLSGDTAYAQQTRGEEGCQETSQTGRDKNQVEGEVQIVSTATQTFLA

                                                                                                                                                                                       The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide, a linker, and an HCV NS3 estine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 62 SINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLIPCTCGSSDLYL 121

                                                                                                                                                                                  NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      22 GSVVIVGRIILSGSGSITAYSQQTRGLLGCKKTSLTGRDKNQVEGEVQVVSTATQSFLAT 81

                                                                                                                                     NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 peptide. A linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 peride is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than
                                                                                                                                                                                                                                                                                                                                                                                                                                         22 GSVVIVGRIILSGSGSITAYSQQTRGLLGCIKTSLTGRDKNQVBGEVQVVSTATQSFLAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS3 estrine protease domain. Where the hydrophobic domain of native HCV NS3 serine protease domain. Where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NNR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Appase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAKA 181

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SINGVLWTVYHGAGTRIIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121
                                                                                      The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS1 serine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity and the ATPase activity of NS3 The covalent NS4A-NS3 complexes are more soluble, stable and active than

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 8
$18030
genome polyprotein - hepatitis C virus (isolate JK1)
N;Contains: capsid protein C; envelope protein N; hepaclvirin (EC 3.4.21.98) (nonstructu
Protein NS4a; nonstructural protein NS4b; nonstructural protein NS5
C;Species: hepatitis C virus
                                                                                                                                                                                                                                                                           genome polyprotein - hepatitis C virus (strain J)
N;Contains: capsid protein C; envelope protein M; major envelope protein E; nonstructural protein NS4s, nonstructural protein NS5
D;Dotein NS4s, nonstructural protein NS4b; nonstructural protein NS5

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALYTIC ACTIVITY: Nucleoside triphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
-!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.
-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.
-!- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Viruses; ssRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 U
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Prince A.M.; "Genomic strain H of hepatitis "Genomic structure of the human prototype strain H of hepatitis virus: comparison with American and Japanese isolates."; Proc. Natl. Acad. Sci. U.S.A. 88:10292-10296(1991).

T. Complex of NS3 protease and NS4 peptide of BK strain hepatitis C
virus: a 2.2-A resolution structure in a hexagonal crystal form.";
Protein Sci. 7:837-847[1998).

I Protein Sci. 7:837-847[1998).

- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE
HYDROPHOBIC, SUGGESTING A POSSIBLE MEMERANE-RELATED FUNCTION.
NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral c precursor polyprotein, commonly with Asp or Glu in the P6
posttion, Cys or Thr in Pl and Ser or Ala in Pl.,
- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                              01-40G-1992 (Rel. 23, Created)

                 LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                REMOVED FROM CAPSID PROTEIN C BY

Genome polyprotein (Contains Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RMa-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J8) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                    (RNA)(N).
-1. SUBUNIT. THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope djycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivith)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48);
Hepatitis C virus (isolate HC-36) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                [RNA][W].

-1- SUBGUIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MENA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    -! SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HCV_RdRP.

Lacono-Connors L.C., Schmaljohn C.S.;

Cloning and sequence analysis of the genes encoding the nonstructural proteins of Langat virus and comparative analysis with other flaviviruses.

1. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

-1. CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                      01-RBF.1993 (Rel. 25, Created)

directed RNA polymerase (EC 2.7.7.48) (NS5)].
Langat virus (strain TP21)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                            SEQUENCE OF 1-776 FROM N.A. SEQUENCE OF 1-776 FROM N.A. Submitted (MAR-1995) to the EMBL/GenBark/DDBJ databases.
-!- FUNCTION: TRANSFERRINS ARE IRON BINDING TRANSPORT PROTEINS WHICH
CAN BIND TWO ATOMS OF FERRIC IRON IN ASSOCIATION WITH THE BINDING
OF AN ANION, USCALLY BICARBONATE. IT IS RESPONSIBLE FOR THE
TRANSPORT OF IRON FROM SITES OF ABSORPTION AND HENE DECRADATION
TO THOSE OF STORAGE AND UTILIZATION. SERMY TRANSFERRIN MAY ALSO
HAVE A FURTHER ROLE IN STIMULATING CELL PROLIFERATION.

RANK RANK OCCOSE POTACL

virus isolated "Characterization and mapping of a B-cell immunogenic domain in hepatitis C virus E2 glycoprotein using a yeast peptide library."; virology 2010;246-255(1994).

-1- SUBDMIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA (BY SIMILARITY).
